### 4.3 Power Spectral Density

#### Test Procedures

Maximum Power Spectral Density (KDB 789033, Method SA-1)

The peak power density is measured with a spectrum analyzer connected to the antenna terminal while the EUT is operating in transmission mode at the appropriate frequencies.

#### Test Settings :

Center frequency = the highest, middle and the lowest channels

- |                                      |                                     |
|--------------------------------------|-------------------------------------|
| a) RBW = 1 MHz                       | b) VBW = 3 MHz                      |
| c) Sweep time = auto                 | d) Detector = power averaging (rms) |
| e) Trace mode = Average at least 100 |                                     |

#### Limit

The maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band.

## 4.4 Frequency Stability

### Test Procedures

The EUT was placed inside of an environmental chamber as the temperature in the chamber was varied between 0 °C and +45 °C(Declaration by the Manufacturer). The temperature was incremented by 10 °C intervals and the unit was allowed to stabilize at each temperature before each measurement. The center frequency of the transmitting channel was evaluated at each temperature and the frequency deviation from the channel's center frequency was recorded.

### Limit

Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user manual.

Frequency [MHz]	Frequency Error (kHz)					
	Temperature					
	0 °C	10 °C	20 °C	30 °C	40 °C	45 °C
<b>5 260</b>	60.887	42.761	26.931	4.154	-2.431	-13.264
<b>5 300</b>	48.920	33.067	19.673	5.706	-9.239	-19.911
<b>5 320</b>	61.489	46.868	25.602	12.787	-5.463	-8.298
<b>5 500</b>	64.112	42.547	22.782	4.513	-6.948	-16.723
<b>5 600</b>	60.958	47.901	24.073	11.305	-6.338	-14.692
<b>5 720</b>	63.326	49.862	26.177	9.949	-10.058	-12.831

### Note :

Based on the results of the frequency stability test shown above the frequency deviation results measured are very small. As such it is determined that the channels at the band edge would remain in-band when the maximum measured frequency deviation noted during the frequency stability tests is applied. Therefore the device is determined to remain operating in band over the temperature range as tested.

This transmitter have its own power supply regulation.

## 4.5 Unwanted Emissions

### Test Location

- 10 m SAC (test distance :  10 m,  3 m)
- 3 m SAC (test distance : 3 m)

### Test Procedures

- 1) In the frequency range of 9 kHz to 30 MHz, magnetic field is measured with Loop Antenna. The Test Antenna is positioned with its plane vertical at 1m distance from the EUT. The center of the Loop Test Antenna is 1m above the ground. During the measurement the Loop Test Antenna rotates about its vertical axis for maximum response at each azimuth about the EUT.
- 2) In the frequency rage above 30 MHz, Bi-Log Test Antenna(30 MHz to 1 GHz) and Horn Test Antenna(above 1 GHz) are used. Test Antenna is 3m away from the EUT. Test Antenna height is carried from 1m to 4m above the ground to determine the maximum value of the field strength. The emissions levels at both horizontal and vertical polarizations should be tested.

#### Test Settings:

Frequency Range = 9 kHz ~ 40 GHz

- a) RBW = 1 MHz for  $f \geq 1$  GHz, 120 kHz for  $f < 1$  GHz, 9 kHz for  $f < 30$  MHz
- b) VBW  $\geq$  RBW
- c) Sweep time = auto

### Limit

- 1) Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in §15.209.

#### **15.209(a)**

Frequency(MHz)	Field Strength uV/m@3m	Field Strength dBuV/m@3m	Deasrement Distance (meters)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705-30	30	-	30
30-88	100	40	3
88-216	150	43.5	3
216-960	200	46	3
Above 960	500	54	3

- 2) For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.

- 3) For transmitters operating in the 5.47-5.725 GHz band: All emissions outside of the 5.47-5.725 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.

\*  $E[\text{dBuV}/\text{m}] = \text{EIRP}[\text{dBm}] - 20\log(d) + 104.77$   
 $E[\text{dBuV}/\text{m}] = \text{EIRP}[\text{dBm}] + 95.2$ , for  $d = 3$  m  
e.i.r.p. -27 dBm => **68.2 dBuV/m**

 <b>CTK Co., Ltd.</b> <i>The Prime Leader of Global Regulatory Certification</i>	<b>CTK Co., Ltd.</b> <b>(Ho-dong), 113, Yejik-ro, Cheoin-gu, Yongin-si, Gyeonggi-do, Korea</b> <b>Tel: +82-31-339-9970</b> <b>Fax: +82-31-624-9501</b>	Report No.: <b>CTK-2018-02328</b> Page (59) / (83) Pages
-------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------

4) The provisions of §15.205 apply to intentional radiators operating under this section.

**15.205 (a)** Except as shown in paragraph (d) of this section, only spurious emissions are permitted in any of the frequency bands listed below:

**Table 1. Restricted Frequency Bands\***

MHz	MHz	MHz	MHz	MHz	GHz
0.09-0.11	8.37626-8.38675	73-74.6	399.9-410	2690-2900	10.6-12.7

8.362-8.366	37.5-38.25	322-335.4	2483.5-2500	9300-9500	

<sup>1</sup> Until February 1, 1999, this restricted band shall be 0.490-0.510 MHz.

<sup>2</sup> Above 38.6

**15.205 (b)** Except as provided in paragraphs (d) and (e), the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in Section 15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in Section 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions.

### Test Setup:

- 1) For field strength of emissions from 9 kHz to 30 MHz

- 2) For field strength of emissions from 30 MHz to 1 GHz

3) For field strength of emissions above 1 GHz

## Test Results

### 1) 9 kHz to 30 MHz

The requirements are:

- Complies

Frequency (MHz)	Measured Data (dBuV/m)	Margin (dB)	Remark
-	-	-	See note

#### Note :

The amplitude of spurious emissions that are attenuated by more than 20 dB below the permissible value has no need to be reported.

Distance extrapolation factor =  $40 \log (\text{specific distance} / \text{test distance})$  (dB)

6	947.135	H	29.6	6.5	36.1	46.0	9.9	101.0

### Remark :

1. The Unwanted emission was measured in the following position: EUT stand-up position(Z axis), lie-down position(X,Y axis). The worst emission was found in lie-down position(X axis) and the worst case was recorded.
2. Result = Reading + c.f(Correction factor)
3. Correction factor = Antenna factor + Cable loss + 6 dB attenuator - Amp Gain
4. This data is the Peak(PK) value.

## 4.6 AC Conducted Emissions

A radio apparatus that is designed to be connected to the public utility (AC) power line shall ensure that the radio frequency voltage, which is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz-30 MHz, shall not exceed the limits.

### Instrument Settings

IF Band Width: 9 kHz

### Test Procedures

The EUT was placed on a non-metallic table 0.8m above the metallic, grounded floor and 0.4m from the reference ground plane wall. The distance to other metallic surfaces was at least 0.8m.

Amplitude measurements were performed with a quasi-peak detector and an average detector.

### Limit

Frequency (MHz)	Conducted Limit (dBuV)	
	Quasi-peak	Average**
0.15 ~ 0.5	66 to 56*	56 to 46*
0.5 ~ 5	56	46
5 ~ 30	60	50

\* The level decreases linearly with the logarithm of the frequency.

\*\* A linear average detector is required.

### Test Results

The requirements are:
